Education

The Pennsylvania State University

September 2021 – Apr 2025 (Anticipated)

Bachelor Of Computer Science

Skills

Languages: Rust, C#, JavaScript, HTML/CSS.

Technologies: Yugabyte, PostgreSQL, Git, GraphQL, gRPC, Figma, ASP.NET Core.

Professional Experience

KeepWorks

Software Engineering Intern

Bengaluru, Karnataka

Dec 2020 – March 2021

- ⇒ Create an open-source crate to query ISO country data to implement multiple currencies, time zones and languages in our product. **This allowed customers from various countries to use our product.**
- ⇒ Design a procedural macro which made server-side sanitizing easy by allowing you to write attributes on the struct declaration itself. The **first open-source crate from KeepWorks**, this **decreased time spent on sanitizing approximately 500 data structures across the codebase.**

KeepWorks

Software Engineering Contractor – Backend Rust Team

Bengaluru, Karnataka

May 2021 – March 2022

- ⇒ Lay foundations for backend applications, connect them to Yugabyte database and setup migrations.
- ⇒ Provide upgrades for our internal CLI tool to allow testing for all our projects and logs in one console instance, **this made testing twice as fast for our all our developers.**
- ⇒ Integrate gRPC and GraphQL microservices in a single rust project to facilitate communication between them which allowed for easier integration between microservices in our products.
- ⇒ Write CRUD operations with diesel and database schemas for our products.

Open-Source Projects

Octane

- ⇒ Octane features a http implementation and its own multithreaded web server built from scratch with express like routing.
- ⇒ Provide SSL/TLS support with both OpenSSL and RustTLS.
- ⇒ Use Tokio to provide multithreading at IO Level.
- ⇒ Write integration tests and unit tests to test server.

RToml

- ⇒ Rtoml features a hand written lexer and a hand written parser.
- ⇒ Comply with the official TOML spec.
- ⇒ Provide support for arrays, numbers, strings, multiline strings with escaping, inline tables and table aliasing in keys.
- ⇒ Write Unit tests for every module, perform integration testing and use existing toml-testing suite

Co-Chat

- ⇒ Use C# and ASP.NET Core with razor pages to create a web chat interface.
- ⇒ Use SignalR to implement websockets on frontend and backend.
- ⇒ Write the frontend in pure CSS (without any framework), vanilla JS to handle UI components.

Croc-Look

- ⇒ A cargo-expand alternative which allows you to debug your procedural macro
- ⇒ cross-term as the backend with clap to parse CLI arguments.
- ⇒ Features a watch option which opens a TUI which shows **live reloaded** generated code from your macros.
- ⇒ Parse rust structs, functions and trait impls to traverse through it for collecting exactly what the user asked for without any clutter.
- ⇒ Write a [5 min long blog post tutorial on croc-look](#).

Iso-rs

- ⇒ Parse iso data json file using serde, phf-codgen to generate lookup tables at compile time.
- ⇒ Build.rs generates lookup table and helper methods to query data.
- ⇒ Place country capitals. Alpha_3, alpha_2 and region data generation behind feature flags to save memory if not needed.

Sanitizer

- ⇒ Provides a procedural macro to automatically generate sanitizing logic for fields with certain types.
- ⇒ Used syn to parse rust tokens, quote to generate code.
- ⇒ Write unit tests to check sanitizers credibility
